This diagram shows an exploded perspective view of a mechanical assembly. The components are numbered as follows:

- 1-5:** A central rectangular frame or housing.
- 6-10:** A series of small, curved components, possibly springs or clips, located at the bottom left.
- 11-16:** A series of small, circular components, possibly washers or spacers, located at the bottom right.
- 17-23:** A series of long, thin, angled components, possibly rods or pins, located on the right side.
- 24-28:** A series of small, rectangular components, possibly spacers or washers, located in the upper right.
- 29-31:** A series of small, curved components, possibly springs or clips, located at the bottom left.
- 32-37:** A series of small, rectangular components, possibly spacers or washers, located in the upper right.

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 30 to 45 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and a training group. The control group consisted of six women who did not participate in any physical activity during the study. The training group consisted of six women who participated in a 10-week training program. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed on a stationary bike at a heart rate of 150 beats per minute. The HR and EE were measured at the beginning and end of the study. The HR and EE of the training group increased significantly over the 10-week period, while the HR and EE of the control group remained relatively stable. The results of this study suggest that a 10-week training program can effectively increase the HR and EE of sedentary, middle-aged women.
